

Package ‘ParsGBIF’

June 14, 2023

Type Package

Title An R package for parsing species occurrence records

Version 0.0.1

Date 2023-06-04

Maintainer Pablo Melo <pablopains@yahoo.com.br>

Description ParsGBIF package is designed to convert GBIF species occurrence data to a more comprehensible format to be used for further analysis, e.g. spatial.

The package provides tools for verifying and standardizing species scientific names and for selecting the most informative species records when duplicates are available.

batch_checkName_wcvp	<i>In batch, use the WCVp database to check accepted names and update synonyms.</i>
----------------------	---

Description

In batch, use the **World Checklist of Vascular Plants database (about WCVp)** to check accepted names and update synonyms.

Usage

```
batch_checkName_wcvp(
  occ = NA,
  wcvp_names = NA,
  if_author_fails_try_without_combinations = TRUE,
  wcvp_selected_fields = "standard"
)
```

Arguments

occ	GBIF occurrence table with selected columns as select_gbif_fields(columns = 'standard').
wcvp_names	WCVp table, wcvp_names.csv file from http://sftp.kew.org/pub/data-repositories/WCVp/ If NA, automatically load the latest version of the database by the function Pars-GBIF::get_wcvp(read_only_to_memory = TRUE)\$wcvp_names.
if_author_fails_try_without_combinations	option for partial verification of the authorship of the species. Remove the authors of combinations, in parentheses.
wcvp_selected_fields	WCVp fields selected as return, 'standard' basic columns, 'all' all available columns.

Details

See help(checkName_wcvp) and **about WCVp database**

#' @author Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro

Value

Data frame with WCVp fields

```

checkName_wcvp	<i>Use the World Checklist of Vascular Plants (WCVp) database to check accepted names and update synonyms</i>
----------------	---

Description

Use the **World Checklist of Vascular Plants database (about WCVp)** to check accepted names and update synonyms.

Usage

```
checkName_wcvp(
  searchedName = "Hemistylus brasiliensis Wedd.",
  wcvp_names = NA,
  if_author_fails_try_without_combinations = TRUE
)
```

Arguments

`searchedName` scientific name, with or without author

`wcvp_names` WCVp table, `wcvp_names.csv` file from <http://sftp.kew.org/pub/data-repositories/WCVp/>
If NA, automatically load the latest version of the database by the function `ParsGBIF::get_wcvp(read_only_to_memory = TRUE)$wcvp_names`.

`if_author_fails_try_without_combinations`
option for partial verification of the authorship of the species. Remove the authors of combinations, in parentheses

Details

About the World Checklist of Vascular Plants <https://powo.science.kew.org/about-wcvp> search-Notes values: Accepted - When only one authorless scientific name is present in the list of `TAXON_name` with and `TAXON_STATUS` equal to "Accepted", `verified_speciesName` = 100. Accepted among homonyms - When more than one authorless scientific name is present in the `TAXON_name` list, but only one of the homonyms displays `TAXON_STATUS` equal to "Accepted", `verified_speciesName` = number of matches/100. Homonyms - When more than one authorless scientific name is present in the `TAXON_name` list and more than one, or none among the homonyms, display `TAXON_STATUS` equal to "Accepted", `verified_speciesName` = number of matches/100. Before searching for homonyms, there was a failure in trying to find the matching match between authorless scientific name in `TAXON_name` and author in `TAXON_AUTHORS`, in these cases `verified_author` equal to 0 (zero), Not Found: When the authorless scientific name is not present in the `TAXON_NAME LIST` Unplaced: o When only one authorless scientific name is present in the list of `TAXON_name` with and `TAXON_STATUS` = "Unplaced" Updated: When only one authorless scientific name is present in the list of `TAXON_name` and `ACCEPTED_PLANT_NAME_ID` are not empty (and `ACCEPTED_PLANT_NAME_ID` is different from the ID of the species consulted) `taxon_status_of_searchedName`, `plant_name_id_of_searchedName` and `taxon_authors_of_searchedName` values: When `searchNotes` equals "Updated" – The fields record the information of the scientific name originally consulted. When `searchNotes` equals "Homonyms" – Fields record the information of homonymous synonyms separated by "|". `verified_author` values: When value equal to 100 – when there is matched match between authorless scientific name in `TAXON_name` and author in `TAXON_AUTHORS`. When value equal to 50 – when there is combined correspondence between authorless scientific name in `TAXON_name` and author, without (combination), in `TAXON_AUTHORS`. When value equal to 0 – regardless of the correspondence between authorless scientific name in `TAXON_name`, author is not present in `TAXON_AUTHORS`.

`get_lastNameRecordedBy`
get_lastNameRecordedBy

Description

Returns the last name of the main collector

Usage

`get_lastNameRecordedBy(x)`

Arguments

x recordedBy field

Details

Returns the last name of the main collector in recordedBy field

Value

last name of the main collector

Author(s)

Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro

See Also

[prepare_collectorsDictionary](#), [update_collectorsDictionary](#)

Examples

```
help(get_lastNameRecordedBy)

get_lastNameRecordedBy('Melo, P.H.A & Monro, A.')

get_lastNameRecordedBy('Monro, A. & Melo, P.H.A')
```

get_wcvp

*get_wcvp***Description**

Download World Checklist of Vascular Plants (WCVp) database

Usage

```
get_wcvp(
  url_source = "http://sftp.kew.org/pub/data-repositories/WCVp/",
  read_only_to_memory = FALSE,
  path_results = "C:/ParsGBIF",
  update = FALSE,
  load_distribution = FALSE
)
```

Arguments

url_source	http://sftp.kew.org/pub/data-repositories/WCVp/
read_only_to_memory	TRUE to in-memory read-only, not writing a copy to local disk
path_results	download destination folder, if read_only_to_memory FALSE
update	TRUE to update and load files, FALSE to keep local version and load files, if read_only_to_memory FALSE
load_distribution	TRUE to load file with geographical distribution of species, if read_only_to_memory FALSE

Details

<http://sftp.kew.org/pub/data-repositories/WCVp/> This is the public SFTP (Secure File Transfer Protocol) site of the Royal Botanic Gardens, Kew. This space contains data resources publicly accessible to the user 'anonymous'. No password required for access. Use of data made available via this site may be subject to legal and licensing restrictions. The README in the top-level directory for each data resource provides specific information about its terms of use.

Value

README_WCVp.xlsx, wcvp_distribution.csv, wcvp_names.csv

Author(s)

Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro

See Also

head(wcvp$wcvp_distribution)
colnames(wcvp$wcvp_distribution)
```

```
prepare_collectorsDictionary
      prepare_collectorsDictionary
```

Description

Returns the list with the last name of the main collector associated with the unique key recordedBy.

Usage

```
prepare_collectorsDictionary(
  occ = NA,
  collectorDictionary_file =
    "https://raw.githubusercontent.com/pablopains/ParsGBIF/main/collectorDictionary/CollectorsDic
  )
```

Arguments

occ	GBIF occurrence table with selected columns as select_gbif_fields(columns = 'standard')
collectorDictionary_file	Collector dictionary file - point to a file on your local disk or upload via git at https://raw.githubusercontent.com/pablopains/ParsGBIF/main/collectorDictionary/CollectorsDictionary

Details

If recordedBy is present in the collector's dictionary, it returns the checked name, if not, it returns the last name of the main collector, extracted from the recordedBy field. If recordedBy is present in the collector's dictionary, returns the main collector's last name associated with the single recordedBy key, otherwise, returns the main collector's last name, extracted from the recordedBy field. It is recommended to curate the main collector's surname, automatically extracted from the recordedBy field. The objective is to standardize the last name of the main collector. That the primary botanical collector of a sample is always recognized by the same last name, standardized in capital letters and non-ascii characters replaced

Value

Ctrl_nameRecordedBy_Standard, Ctrl_recordedBy, Ctrl_notes, collectorDictionary, Ctrl_update, collectorName, Ctrl_fullName, Ctrl_fullNameII, CVStarrVirtualHerbarium_PersonDetails

          na = "")
```

```
prepare_gbif_occurrence_data
```

```
    prepare_gbif_occurrence_data
```

Description

Prepare occurrence data from GBIF to use in package

Usage

```
prepare_gbif_occurrence_data(  
  occ = NA,  
  gbif_occurrence_file =  
    "https://raw.githubusercontent.com/pablopains/ParsGBIF/main/dataGBIF/Achatocarpaceae/occurrence_data.csv",  
  columns = "standard"  
)
```

Arguments

occ	GBIF occurrence table
gbif_occurrence_file	if occ is NA, load original occurrence file from gbif
columns	'standard' basic columns about what, when, where, and who collected, 'all' all available columns or list column names. See select_gbif_fields() function

Details

Prepare occurrence data from GBIF to use in package. Select the data fields to be used. Add "Ctrl_" at the beginning of each field name

Value

data.frame with fields selected by the select_gbif_fields function and with "Ctrl_" at the beginning of each field name

Author(s)

Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro

colnames(occ)  
  
head(occ)
```

```
select_digital_voucher_and_sample_identification
      select_digital_voucher_and_sample_identification
```

Description

Extract gbif issue

Usage

```
select_digital_voucher_and_sample_identification(
  occ = NA,
  occ_gbif_issue = NA,
  occ_checkName_wcvp = NA,
  occ_collectorsDictionary = NA,
  enumOccurrenceIssue = NA
)
```

Arguments

occ GBIF occurrence table with selected columns as select_gbif_fields(columns = 'standard')

occ_gbif_issue = result of function extract_gbif_issue()\$occ_gbif_issue

occ_checkName_wcvp
= result of function batch_checkName_wcvp()\$occ_checkName_wcvp

occ_collectorsDictionary
= result of function update_collectorsDictionary()\$occ_collectorsDictionary

enumOccurrenceIssue
An enumeration of validation rules for single occurrence records by GBIF file, if NA, will be used, data(EnumOccurrenceIssue)

Details

To group duplicates: 1) If the key to group duplicates is incomplete: Sample duplicates cannot be grouped due to missing collector information and/or collection number. Each record is considered a sample, with no duplicates. Select a voucher for each sample. Or, 2) If the key to group duplicates is complete: Group duplicates. Select a voucher, with the highest information score, among the duplicates in the sample. How to calculate the information score? $\text{moreInformativeRecord} = \text{sum of verbatim quality} + \text{quality of geospatial information}$. $\text{verbatim quality} = \text{sum of the number of flags with verbatim quality equal to TRUE}$. $\text{quality of geospatial information} = \text{If there is a geospatial issue, consider the one with the highest priority, with the highest score}$. To select sample taxonomic identification: 1) If the key for grouping duplicates is complete: select the accepted TAXON_NAME, identified up to or below the specific level, most frequent among the duplicates in the sample. If tie between frequency of accepted TAXON_NAME, identified up to or below the specific level: select the first accepted TAXON_NAME, identified up to or below the specific level, in alphabetical order. If there is no identification, at or below the specific level, for the sample: Indicate as unidentified sample. Or, 2) If the key for grouping duplicates is incomplete: select TAXON_NAME, if accepted and identified up to or below the specified level. If there is no identification, at or below the specific level, for the sample: Indicate as unidentified sample.

Value

matchStatusDuplicates - "matched", "unmatched: no recordedBy and no recordNumber", "unmatched: no recordNumber" or "unmatched: no recordedBy" numberTaxonNamesSample - count of the different accepted scientific names, identified up to or below the specific level, listed in the sample duplicates, or Zero, if there is no identification, equal to or below the specific level, for the sample. sampleTaxonName - TAXON_name accepted and identified up to or below the specific level selected for the sample. sampleIdentificationStatus - 'Identified', 'divergent identifications', or 'unidentified'

Examples

```
# select_gbif_fields()

help(select_gbif_fields)

col_sel <- select_gbif_fields(columns = 'all')

col_sel <- select_gbif_fields(columns = 'standard')
```

standardize_scientificName

standardize_scientificName

Description

standardize binomial name, variety, subspecies, form and hybrids, authorship to allow comparison with names of taxa in the World Checklist of Vascular Plants (WCVF) database

Usage

```
standardize_scientificName(
  searchedName = "Alomia angustata (Gardner) Benth. ex Baker"
)
```

Arguments

searchedName scientific name, with or without author

Details

Standardize scientific name according to WCVF format. Separate generic epithet, specific epithet, variety, subspecies, form, hybrid and author, in the scientific name, if any. Standardize, according to WCVF, abbreviation of infrataxon, if any: variety to var., subspecies to subsp., FORM to f., hybrid separator separate x from the specific epithet.

Value

searchedName, standardizedName, taxonAuthors, taxonAuthors_last

Author(s)

Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro

See Also

[get_wcvf](#), [checkName_wcvf](#)

Examples

```
# standardize_scientificName()

help(standardize_scientificName)

standardize_scientificName('Leucanthemum *superbum (Bergmans ex J.W.Ingram) D.H.Kent')
standardize_scientificName('Alomia angustata (Gardner) Benth. ex Baker')
standardize_scientificName('Centaurea *aemiliae Font Quer')
```

update_collectorsDictionary

update_collectorsDictionary

Description

Include recordedByStandardized field with verified main collector's last name. Include recordNumber_Standard field with only numbers from recordNumber. Create a key to group duplicates in the key_family_recordedBy_recordNumber field, composed of the fields: family + recordedByStandardized + recordNumber_Standard.

Usage

```
update_collectorsDictionary(
  occ = NA,
  collectorDictionary_checked_file = NA,
  collectorDictionary_file =
    "https://raw.githubusercontent.com/pablopains/ParsGBIF/main/collectorDictionary/CollectorsDic
  )
```

Arguments

`occ` GBIF occurrence table with selected columns as `select_gbif_fields(columns = 'standard')`

`collectorDictionary_checked_file` Verified collector dictionary file - point to a file on your local disk

`collectorDictionary_file` Collector dictionary file - point to a file on your local disk or upload via git at <https://raw.githubusercontent.com/pablopains/ParsGBIF/main/collectorDictionary/CollectorsDictionary>

Details

....

Value

`occ_collectorsDictionary`: `nameRecordedBy_Standard`, `recordNumber_Standard`, `key_family_recordedBy_recordNumber`, `key_year_recordedBy_recordNumber` summary, `collectorsDictionary_add`

Author(s)

Pablo Hendrigo Alves de Melo, Nadia Bystriakova & Alexandre Monro
